

Tazzari EV Zero Emission Mobility

Zero Next Generation is Tazzari EV response to the new urban mobility needs, with Zero EM2 Space being the top of the range product.

After 11 years of experience in the electric mobility, a market which demands are in continuous evolution in terms of performance and efficiency, the next generation of Tazzari EV vehicles is a real benchmark in the electric city car world.

Hand made in Imola, in the heart of the Italian Motor Valley, the aluminum components designed and casted inside the Tazzari Group foundries are assembled together with steel reinforcements using aerospace structural adhesives. The result is a motorsport concept chassis that mixed with the unparalleled performance of the electric powertrain is able to deliver sheer driving emotions and yet preserving the usability of a super compact city car.

Don't let the overall length of 2.890 mm fool you, with two loading compartments and a total volume of 400 liters, Zero EM2 Space can be easily parked in small spaces but its tailor-made high quality eco-leather (no animals where harmed!) Italian interiors will embrace you like a real premium car.

Zero EM2 Space achieved a total range of 194 km during homologation tests with 14.2 kWh battery, an impressive result which is an absolute record for the category. This result is due to the third BMS generation and our ultra-light technology, two of the key elements for the best in class efficiency.

On www.tazzari-zero.com it is possible to customize your favorite Zero with more than 8.000 three color combinations, in addition to other 15 dedicated to the fine interiors, each Zero is like a one-off Italian supercar in a city car size with state of the art electric technology.
